

REST TRACKING API V4 JSON BASED

Overview:

Representational state transfer (REST) or **RESTful** web service are one way of providing interoperability between computer systems on the Internet. REST-compliant web services allow requesting systems to access and manipulate textual representations of web services using a uniform and predefined set of stateless operations. Other forms of web service exist, which expose their own arbitrary sets of operations such as WSDL and SOAP.

To make a web API call from a client application, you must supply an authentication token on the call. The token acts like an electronic key that lets you access the API.

DTDC Tracking services allow third party providers to integrate DTDC tracking services into a platform or website. Once integrated your application will access DTDC servers over REST style architecture using XML/JSON.

Authentication token request
